

Build Your Own Tool

Homework: Tools & Memory

Name:

Date:

No computer needed! Show what you remember about building tools and giving your agent a memory. Finish with a quick design challenge.

Part 1 — Matching

Write the letter of the correct definition in the box next to each term.

- A. A small program that offers one or more tools an agent can call.
- B. A single function the agent can use to do something.
- C. The note inside a function that tells the agent WHEN to use it.
- D. The file (AGENTS.md) where an agent saves things to remember.
- E. Reloading opencode so it notices a change you made.
- F. What the agent passes into a tool so it can do its job.

Tool

Docstring

Memory file

Restart

Input

Part 2 — True or False

Write T (true) or F (false) in each box.

A tool is really just a function the agent can call.

The docstring helps the agent decide when to use a tool.

You must restart opencode for it to notice a new tool.

An agent remembers everything forever, even without a memory file.

You can have the agent write the tool's code for you.

Part 3 — Short Answer

1. Why is a clear docstring important for a tool?

2. Explain how AGENTS.md lets an agent remember you after a restart.

3. What are the three steps of Build, Restart, Test, and why does restart matter?

Part 4 — Design a Tool

Invent a tool for your agent and plan it out below.

Tool name:

What does it do?

What input does it need?

Write a clear docstring for it (when should the agent use it?):
